

New generation DBS systems view and receive signals from satellites in multiple orbital locations to provide HDTV programming and local-to-local television programming. This multiswitch takes the signals from two dual LNBs and the signal from an off-air antenna or cable TV and distributes them to four satellite receivers. Satellite and off-air signals are separated at the DSS receiver using a diplexer. This multiswitch is weatherproof so you may mount it outdoors.

Input: Five F-Type Female
Output: Four F-Type Female
